Bob, I have received your letter. I have contacted Scott and shared it with him.

His response was that " I do not want to get involved with the bubbler pipe". He suggested that if that was the route we wanted to go then we should find another contractor to do that work.

He believes that his proposal will turn the water over 11 times each day and will improve oxygen levels at the bottom muck level. He has studies that document this.

If we wanted to go the bubbler pipe route then we need to find someone who can install AND maintain it... I don't know of anyone.

I did find out that the Oxygenation Units are again available. This new technology would be far superior to either traditional aeration or to bubbler pipe. I think that we should pause the process until I have researched this new technology further, as even though it may be more expensive it could possibly be a major breakthrough for the harbor....

So, we are going to do nothing for now until further research is completed.

Thanks, Bob.
